(*Department of Biology, Northwest Normal University*, Lanzhou 730070)

Key words *Wikstroemia*; *W. subcyclolepidota*
关键词 荛花属；亚环鳞荛花

亚环鳞荛花 新种 图1

Wikstroemia subcyclolepidota L. P. Liu et Lian, sp. nov.

Species *W. pampaninii* Rehd. affinis, a qua differt disci squama 1 fere cyclicali, apice saepe 7-lobata, lobis dentiformibus vel linearibus, foliis suboppositis, rarius alternatis vel oppositis.

Frutex circ. 1 m altus, ramis gracilibus. Ramuli teretes, hornotini, praesertim apicem versus, pilis albidis subadpressis dense obtecti, annotini glabrescentes ut vetustiores fusco-purpurei. Gemmae subglobosae, conspicue albido-tomentosae. Folia subopposita, rarius alternata vel opposita, tenuiter chartacea, in sicco membranacea, elliptica vel ovato-elliptica, 1.5～3 cm longa, 1.2～2 cm lata, apice acuta, basi late cuneata vel subrotuntata, utrinque adpresse pubescentia, nervis lateralibus utrinque 3～4 supra tenuibus subtus inconspicuis; petiolis circ. 1 mm longis, dense pubescentibus. Flores flavo-virentes in fasciculos 1～6-florigeros ad apicem ramulorum et in axillis foliorum supra medium ramulorum aggregati, pedicellis fere 0.3 mm longis. Perianthii tubus dense adpresse pilosus, 5～7 mm longus, lobis 4 breviter oblongis vel ovatis extus pilosis 1.5 mm longis, apice acutis vel rotundatis. Stamina 8, biseriata, 4 superiora infra faucem tubi inserta, 4 inferiora supra medium tubi inserta, filamentis vix 0.2 mm longis, antheris oblongis. Pistillum 2.5 mm longum, ovario pilis adpressis dense obtecto, stylo brevissimo, stigmate capitato. Disci squama unica, subo-
